Serious Complications of Diabetes Continuously elevated blood sugar levels that occur when either type of diabetes goes untreated can lead to serious health complications over time. Circulation to the feet and other extremities could slow down, reducing oxygen to these parts of the body. If you have prediabetes, lifestyle changes may be enough to halt the progression of symptoms and prevent the development of actual diabetes. It is most often diagnosed in adults after lab results indicate an elevated blood glucose level during a routine checkup with blood testing. Photo Courtesy: @ADA_DiabetesPro/Twitter Diabetes impacts the lives of more than 34 million Americans, which adds up to more than 10% of the population. In fact, if you spot the signs of a potential problem at the prediabetes stage of the disease, you may be able to halt the progression before you ever develop Type 2 diabetes. That means your pancreas is making insulin, but your body isn't using it correctly. Type 2 diabetes often develops gradually over time and is frequently preceded by prediabetes. Symptoms of Type 1 Diabetes Many people think of Type 1 diabetes as juvenile diabetes, mainly because it often develops in children, but it can begin at any age. Unfortunately, many people don't notice the symptoms until the disease moves past the prediabetes phase and becomes more serious. Diet and exercises are important for disease management, but insulin replacement is required for those with Type 1 diabetes. However, some people notice darkened patches of skin around the neck, armpits, elbows, knuckles and knees. Common symptoms of Type 1 diabetes that eventually appear include weight loss, dehydration, frequent urination, excessive thirst and hunger, fatigue, blurry vision and wounds that won't heal. Prediabetes almost always exists as a warning sign before diabetes develops, but it often doesn't cause symptoms that would make it easy to spot. Burns and other wounds that curl slowly due to diabetes can be seriously infected, possibly leading to nerve damage or membership amputation. Many of the first signs of type 2 diabetes are the same as type 1, such as frequent mic, higher thirsty and appetite, low power levels, wounds that do not heal and the vision blurring. However, people with type 2 usually earn weight of losing weight and can experience sleeping or tingling in their hands and feet. Some people with type 2 diabetes are capable of managing disease by changing their diet and exercising several times a week. This type of diabetes occurs when the body becomes resistant to the effects of insulin. Diabetes are not treated can cause serious complications and eventually become a life threatening, but early detection increases the likelihood of successfully managing disease with a treatment plan effective. Symptoms of diabetes type 2 type 2 diabetes affects the body in similar ways, but it is not physiologically the same as type 1. Others need to take insulin injections or oral medicines, in addition to changing their diet and Exercises. If the diabetic ketoacidosis occurs from excessive academic of ketone in the blood, it can result in a diabetic coma or even death. Our cells use insulin to control the nozzle levels in the blood in the blood and convert it to fuel to the body. When the pancreas do not do more insulin or do not insulin almost enough, it causes many dangerous complications. Resource Links: - Cuts / SYC -20371444 1 / HTTPS symptoms : //www.diabetes.org/diabetes/type-2/symptoms MORE OF SYMPTOMFIND.COM With the birth of type 1 diabetes in adults, many patients are misdiagnosed with type 2 diabetes. Risk factors for developing pr'diabetes include overweight, diet with a lot of added car and processed foods, inactivity, age and family history of diabetes. Damage to 3 caused by high levels of heart damage in the blood may extend to the kidneys and heart, possibly resulting in kidney disease, cancer and stroke. In extreme cases, blurred vision can lead to diab retinopathy and loss of vision. Start by familiarizing yourself with the risk factors for diabetes and the signs you need to observe that may indicate the onset of the disease. When you do not consider the magnitude of this number, it is easy to understand why everyone needs to be aware of the signs of the disease. Early recognition of these symptoms can help in 3 diagnosis and rapid intervention, which in turn reduces the risk of more severe 3. Also 3m 3 3 older ages are more difficult to diagnose because many adults do this 3 3 3 If the condition is not 3 treated, the body will end up in a state of diab 3 tic ketoacidosis, which means that acidic ketones accumulate in the blood, along with the excess of sodium released by the liver. In some cases, a well-trained child eats to wet the bed again night, indicating a problem. Dark skin spots, yeast 3 and itching may also occur. In adults, excessive symptoms of Type 1 diabetes may not appear immediately. 3 3 it is important to exercise a lot and establish healthy eating habits with limited sugars, salt and saturated fat. When this high levels of glucose and ketone can damage the nerves and tissues of the kidneys, heart and eyes. Type 1 diabetes 3 3 Difference Adults and Children Type 1 diabetes in children often manifests itself with weight loss, intake of large amounts of liquids, frequent heartbeat and fatigue. A single glycaemic assessment will indicate whether the child has a high blood glucose level and a 3 of type 1 diabetes. This type of diabetes occurs when the immune system attacks the 3 squid that make the insulin, insulin.
